

# Child Privacy OSINT Audit

Subject: Sylvie M. Parris (minor) | Prepared for parent/guardian remediation | Redacted report

Child-safety handling: This report intentionally avoids reproducing child images and redacts sensitive details. It is designed to help parents remove or reduce public exposure, not to republish it.

## 1. Executive Summary

Overall exposure level: Medium-High. I did not find a confirmed direct home address, phone number, or confirmed current school/preschool page in this pass. The main risk is aggregation: public apps, GitHub repos, Vercel/GitHub Pages deployments, and social snippets together connect the child's first name, family structure, interests, age/developmental context, bedtime/media routines, and parent identities.

Top priority: make child-related GitHub repositories private, take public deployments offline or password-protect them, remove children's names from parent social bios/public comments, and remove any post that uses the child's full name or visible photo.

## 2. Public Exposure Map

| Status                      | Exposure                                                             | Source                                                                                                                                                                                                                                                                                                                                                                              | Notes                                                     |
|-----------------------------|----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| Confirmed                   | Public child-learning app using first name                           | <a href="https://joshualparris.github.io/SylviePhonetics/">https://joshualparris.github.io/SylviePhonetics/</a>                                                                                                                                                                                                                                                                     | Live GitHub Pages app.                                    |
| Confirmed                   | Public child-learning GitHub repo                                    | <a href="https://github.com/joshualparris/SylviePhonetics">https://github.com/joshualparris/SylviePhonetics</a>                                                                                                                                                                                                                                                                     | Named for child; includes source, README, PDF filename.   |
| Confirmed                   | Public bedtime app using first name and Dad/family routine language  | <a href="https://joshualparris.github.io/Sleepy/">https://joshualparris.github.io/Sleepy/</a>                                                                                                                                                                                                                                                                                       | Live GitHub Pages app.                                    |
| Confirmed                   | Public bedtime GitHub repo with watch-history-derived files          | <a href="https://github.com/joshualparris/Sleepy">https://github.com/joshualparris/Sleepy</a>                                                                                                                                                                                                                                                                                       | Includes raw text and ZIP files.                          |
| Confirmed                   | Public React/Vercel child play app repo                              | <a href="https://github.com/joshuaparris-max/SylvieApp">https://github.com/joshuaparris-max/SylvieApp</a>                                                                                                                                                                                                                                                                           | Named SylvieApp with child-specific activities/interests. |
| Likely/Confirmed by snippet | Public social snippet with full child name and parent tags           | <a href="https://www.instagram.com/p/CsQQei8r_cy/">https://www.instagram.com/p/CsQQei8r_cy/</a>                                                                                                                                                                                                                                                                                     | Search snippet only; manual verification needed.          |
| Confirmed by snippet        | Parent Instagram bio exposing children's first names                 | <a href="https://www.instagram.com/kjp4rris/">https://www.instagram.com/kjp4rris/</a>                                                                                                                                                                                                                                                                                               | Public snippet; do not need to access private posts.      |
| Confirmed by snippet        | Public Facebook/group snippets with child names and events/locations | <a href="https://www.facebook.com/electricwonderlandbendigo/posts/%EF%B8%8F-competition-now-closed-%EF%B8%8F-%EF%B8%8Fcongratulations-to-melaniecollins_-youve-won-a-famil/658416787236175/">https://www.facebook.com/electricwonderlandbendigo/posts/%EF%B8%8F-competition-now-closed-%EF%B8%8F-%EF%B8%8Fcongratulations-to-melaniecollins_-youve-won-a-famil/658416787236175/</a> | Snippet only; manual review in Facebook recommended.      |

## 3. Public Data Inventory

### 1. Public Instagram search snippet appears to name the child fully and tag both parents

Severity: High | Confidence: Medium-High

Source: [https://www.instagram.com/p/CsQQei8r\\_cy/](https://www.instagram.com/p/CsQQei8r_cy/)

Data exposed: Search result snippet appears to expose full child name, family relationship, parent handles, and likely a child/family image. I could not fetch the post directly because Instagram throttled the page, so treat this as snippet-confirmed and manually verify in Instagram.

Why it matters: This is the strongest identity-linking exposure: full name + parents + social post. If a face is visible, it should be removed or made private.

Recommended action: Ask the account owner to archive/delete the post, remove the full name, remove parent tags, or restrict audience. Then request search result refresh/removal.

## 2. Kristy's public Instagram snippet links family structure by first names

Severity: Medium-High | Confidence: High

Source: <https://www.instagram.com/kjp4rris/>

Data exposed: Public profile snippet lists Kristy Parris and names Josh, Sylvie, and Elias in a family context. I did not access private Instagram content.

Why it matters: Combines parent identity with children's first names and public family structure. This increases discoverability when combined with apps and GitHub repos.

Recommended action: Make account private, remove children's names from public bio, or use initials/nicknames only.

## 3. Public child app: Sylvie's Phonics Adventure

Severity: High | Confidence: High

Source: <https://joshualparris.github.io/SylviePhonetics/>

Data exposed: Live public GitHub Pages app uses the child's first name in the title and copy. It exposes age/literacy settings, parent-coach content, microphone/speech practice, Australian/NSW/VIC early-years context, and references a bright four-year-old learner.

Why it matters: The app is not inherently unsafe, but public indexing ties a specific child's first name to age, literacy/developmental context, parent-created learning support, and family education routines.

Recommended action: Make private or rename to a neutral non-identifying title. Remove first name, age-specific wording, and SEO indexing. Consider noindex if it must stay online.

## 4. Public GitHub repo: joshualparris/SylviePhonetics

Severity: High | Confidence: High

Source: <https://github.com/joshualparris/SylviePhonetics>

Data exposed: Repository is public and named for the child. It includes app source, README, commits, deployment URL, and a public PDF report file with the child's name in the filename.

Why it matters: GitHub provides searchable, durable public indexing. Even after deletion, repo/commit/file names can remain discoverable in caches or archives.

Recommended action: Make repo private today. Remove public deployment, delete or rename child-identifying PDF/file names, and rotate/deindex related GitHub Pages URLs if possible.

## 5. Public child bedtime app: Sylvie's Sleepy Stories

Severity: High | Confidence: High

Source: <https://joshualparris.github.io/Sleepy/>

Data exposed: Live app uses child's first name, says it is built around bedtime favourites, says "Made with for Sylvie - by Dad", mentions screen transition timing, and references sibling proximity.

Why it matters: This reveals family routine, parent-child relationship, sibling context, and media habits. Bedtime/routine exposure is higher-risk than a generic play app.

Recommended action: Take offline or password-protect. Remove child name, "by Dad", sibling mention, and routine timing from any public version.

## 6. Public GitHub repo: joshualparris/Sleepy includes watch-history-derived files

Severity: High | Confidence: High

Source: <https://github.com/joshualparris/Sleepy>

Data exposed: Repo is public and includes files such as "bedtimes with sylvie.txt", library JSON, and ZIP files. The raw text file appears to contain a YouTube/watch-history style export including children's videos plus adult/news/AI/political/faith content.

Why it matters: This is a household privacy exposure: child routine + media habits + broader family viewing history. It may reveal interests, timing clues, and bedtime patterns.

Recommended action: Make repo private immediately. Delete watch-history files and ZIPs from public history if possible; use git history rewrite if you need them removed from commit history.

## 7. Public Vercel/GitHub app: SylvieApp

Severity: Medium-High | Confidence: High

Source: <https://github.com/joshuaparris-max/SylvieApp>

Data exposed: Public repo says SylvieApp is a calm play world for Sylvie. It lists interests/themes such as fairy garden, farm adventure, princess dress-up, colouring, puzzles, sorting truck, trampoline/swing, story corner, calm-down screen, and parent settings.

Why it matters: The content paints a fairly specific profile of the child's interests and support needs when combined with parent accounts and other apps.

Recommended action: Make repo private or rename to a neutral demo name. Strip child name from README, package metadata, route titles, docs, and deployment.

## 8. Public parent settings/passcode in SylvieApp docs

Severity: Medium | Confidence: High

Source: <https://raw.githubusercontent.com/joshuaparris-max/SylvieApp/main/docs/content-and-safety.md>

Data exposed: Public docs state the default parent passcode and describe locally stored child progress/drawing/settings data.

Why it matters: This is not a cloud account password, but public parent-control defaults are still bad practice. If the app is used by the child, anyone with device access can infer or bypass parent settings.

Recommended action: Remove default passcode from public docs, change it in the app, and avoid publishing family-use passcodes in repos.

## 9. Public Facebook snippets connect children's first names to events/locations

Severity: Medium | Confidence: Medium

Source: [https://www.facebook.com/electricwonderlandbendigo/posts/%EF%B8%8F-competition-now-closed-%EF%B8%8F-%EF%B8%8Fcongratulations-to-melaniecollins\\_-youve-won-a-famil/658416787236175/](https://www.facebook.com/electricwonderlandbendigo/posts/%EF%B8%8F-competition-now-closed-%EF%B8%8F-%EF%B8%8Fcongratulations-to-melaniecollins_-youve-won-a-famil/658416787236175/)

Data exposed: Public search snippets show Kristy commenting with children's first names in relation to events. I did not access private Facebook content.

Why it matters: These snippets can reveal children's names, local activities, and rough location/time context through search engines.

Recommended action: Review Facebook activity log and old public group comments. Delete comments or reduce visibility where children's names/locations appear.

## 10. Public playgroup/community snippets mention family logistics

Severity: Medium | Confidence: Medium

Source: <https://www.facebook.com/groups/bendigoplaygroups/posts/668631395878403/>

Data exposed: Public search snippet shows Kristy commenting about being in Ballarat and watching/reading with Sylvie. This was snippet-only because Facebook content was not directly accessible without throttling/login limits.

Why it matters: This is lower than full-name exposure, but contributes to location pattern and child-name aggregation.

Recommended action: Review public group comments, especially community/playgroup/church pages. Remove location-linked child mentions where possible.

## 11. False positives for unrelated adults named Sylvie Parris

Severity: Low | Confidence: High

Source: [Search results for "Sylvie Parris"](#)

Data exposed: Results include an unrelated author, social profiles, and other people named Sylvie Parris. These do not appear connected to your child.

Why it matters: False positives are not a privacy breach, but they can make manual searching harder and may hide relevant results.

Recommended action: Ignore unless they begin appearing mixed with family identifiers such as Josh/Kristy/Dubbo/Bendigo.

## 4. Images and Media Risk

- Do not copy or download child images into remediation documents unless absolutely necessary. Use URLs and descriptions instead.
- The most important item to manually check is the Instagram snippet that appears to use the child's full name and tag both parents. If the child's face is visible, treat it as high priority for removal or audience restriction.
- Review parent Instagram/Facebook/YouTube accounts for public posts, tags, reels, profile images, thumbnails, comments, and public group interactions that combine children's names with faces, locations, or family routines.

## 5. Health, Therapy, and Developmental Privacy Risk

- I did not confirm a public NDIS/therapy/report page for the child in this pass.
- The child app ecosystem does expose developmental/education-adjacent context, such as literacy age settings, parent coaching, emotion/body-regulation prompts, movement breaks, and preschool/early-years framing.
- Keep NDIS, therapy provider names, diagnoses, reports, and intervention plans out of public repos, app copy, filenames, PDFs, screenshots, and prompts.

## 6. App, GitHub, and Vercel Risk

- Highest priority repos/apps: SylviePhonetics, Sleepy, SylvieApp, plus any forks/ZIPs/deployments created from them.
- Public repo names and deployment URLs are child-identifying even when content is benign.
- Files to review closely: README files, public docs, PDFs, ZIPs, raw text exports, source data files, app metadata, package.json, Vercel config, screenshots, and commit history.
- The Sleepy repo needs special care because it appears to include watch-history-derived data; do not leave that public.

## 7. Family and Location Inference

- A viewer could connect parent names/handles, sibling first name, family faith language, child interests, child learning apps, bedtime/media routines, and historical town/activity clues.
- I did not confirm a current direct address or current school/preschool result in public web search during this pass.
- Risk rises when first name + family name/parents + age/development + routine/location appear together.

## 8. Removal Plan - Do Today

- Make these public repos private: joshualparris/SylviePhonetics, joshualparris/Sleepy, joshualparris-max/SylvieApp, and any child-name forks or backups.
- Disable, delete, or password-protect these deployments: SylviePhonetics, Sleepy, SylvieApp/Vercel.
- Remove the child's name from app titles, repo names, README files, PDFs, filenames, metadata, package names, and page titles.
- Delete or private the watch-history-derived file and ZIPs in the Sleepy repo; if needed, rewrite Git history before making public again.
- Ask family/account owners to remove posts/snippets that use the child's full name, face, parent tags, or location clues.

## 9. Removal Plan - Do This Week

- Review Facebook activity logs for both parents: public posts, comments in groups, tags, albums, profile/cover photos, and old event replies.
- Review Instagram bios and public posts. Remove children's names from public bios; make parent accounts private if appropriate.
- Search Google/Bing for exact child name, first name + parent names, and app names after taking pages down. Request removal of stale results.
- Check Wayback Machine for child-related app URLs and request exclusion where you control the site/repo/account.

- Replace child-name apps with neutral names such as “Family Phonics Demo”, “Bedtime Shelf”, or “Little Garden App”.

## 10. Removal Plan - Do This Month

- Create a family rule: no public full child names, no school/preschool names, no medical/developmental details, no routine/location clues, and no public face photos unless both parents deliberately agree.
- Set up alerts for child name variants and parent+child combinations.
- Run a quarterly child privacy audit across GitHub, Vercel, Facebook, Instagram, YouTube, Google Drive sharing links, and old websites.
- Keep child apps private by default. If public, use demo data, fictional names, no personal photos, no private routines, and no SEO indexing.

## 11. Takedown and Privacy Steps

- GitHub: open the repo -> Settings -> Danger Zone -> Change repository visibility -> Private. Review Pages settings and disable GitHub Pages if not needed.
- Vercel: use Deployment Protection/password protection or delete the project/deployment. Also remove public custom domains if any.
- Google: use “Remove web results from Google Search” after source content is removed or if sensitive personal information appears.
- Bing: use Bing Webmaster content removal after content is removed or blocked at source.
- Instagram/Facebook: make parent profiles private, remove children’s names from bios, remove public tags, and archive/delete child posts.
- YouTube: set child/family videos to Private, not merely Unlisted, if you want stronger privacy.
- Wayback Machine: email/request exclusion for URLs you controlled, including GitHub Pages and Vercel pages where possible.

## 12. Final Recommendations

- Fix the source first: repos, apps, public posts, and bios. Search-engine removal only works properly after the source is removed or restricted.
- The public child apps are creative and loving, but they should not use real child identifiers in public URLs, repo names, or metadata.
- Treat bedtime routines and developmental/therapy information as private by default.
- This report is a snapshot, not a complete guarantee. Social platforms and search snippets can change, and some results were snippet-only due to access/throttling limits.

## 13. Useful Links

| Purpose                                             | URL                                                                                                                                                                                                                                                                                                           |
