

Child Privacy OSINT Audit

Elias D. Parris - Defensive public exposure audit for parent/guardian use

Generated: 5 June 2026. This report is intentionally redacted. Do not upload it publicly or attach it to public repositories.

1. Executive Summary

Overall exposure level: Medium-High for a minor. The exposure is not widespread across many independent websites, but the exposed items are sensitive because they combine a child identity with parent identity, birth information, and a public child-specific app/repository trail.

Top priority: remove or privatise the public birth-announcement snippets and duplicate shares/cross-posts. This is the highest-risk item because it exposes full identity plus birth details in searchable social snippets.

Second priority: take EliasApp2 and the Vercel deployment private or rename them to neutral, non-identifying names. Public child-named apps are easy to index, archive, and connect to parent GitHub accounts.

No direct evidence of exposed child address, childcare location, medical reports, scans, or private documents was confirmed in this pass. Manual checking of private social account visibility and parent photo albums is still needed.

Highest priority actions

- [] Delete or restrict the Facebook birth announcement and any duplicate cross-posts/shares.
- [] Make <https://github.com/joshuaparris-max/EliasApp2> private today, or delete it if not needed.
- [] Delete or password-protect <https://elias-app2.vercel.app/> through Vercel Deployment Protection.
- [] Rename all public child-first-name metadata: app title, manifest, README, icon names, package names, repository names, and URLs.
- [] Search the exact full-name phrase after cleanup and submit outdated-content removal requests for remaining snippets.

2. Public Exposure Map

Status	Exposure	Source	Confidence
Confirmed	Public birth-announcement snippet	Facebook group/search snippet: facebook.com/groups/305949551553/posts/10162374081636554/	High
Confirmed	Duplicate/related Facebook profile or photo snippet	Facebook profile/photo snippet: facebook.com/joshualukeparris/photos/d41d8cd9/10162799841139899/	High
Confirmed	Public child-specific Vercel app	https://elias-app2.vercel.app/	High
Confirmed	Public GitHub repository tied to child app	https://github.com/joshuaparris-max/EliasApp2	High
Confirmed	Public app metadata contains child name	GitHub index.html and manifest.webmanifest in EliasApp2	High
Likely / verify	README references adding photos for the child	EliasApp2 README on GitHub	Medium-High
Confirmed	Public source code reveals child-specific interests	Raw GitHub files: src/data/sections.js , src/data/tools.js , src/data/videos.js	High
Confirmed	Public embedded video list	EliasApp2 src/data/videos.js	High
Confirmed	Search snippets connect parent public profiles to child exposure	Parent public profiles/snippets: YouTube, LinkedIn, Threads, Simple Wikipedia, Facebook snippets	High
Likely / verify	Potential stale/archived search snippets	Google/Bing-style snippets returned pages that may be hard to fetch directly or may require login.	Medium

Status	Exposure	Source	Confidence
Likely / verify	Genealogy/profile ecosystem exposure around parent name	WikiTree result for Joshua Parris and public genealogy results mentioning Parris family lines	Medium

3. Public Data Inventory

F1. Public birth-announcement snippet - Critical (High)

Source: Facebook group/search snippet: [facebook.com/groups/305949551553/posts/10162374081636554/](https://www.facebook.com/groups/305949551553/posts/10162374081636554/)

Data exposed: Full child name, parent name, exact birth date/time wording, and health/status language were visible in public search snippets.

Why it matters: This joins identity + parent + birth details in one searchable result. For a minor, this should not remain public.

Recommended action: Set original post(s) to private/friends-only or delete them. Search the exact full-name phrase afterwards. Submit Google/Bing outdated-content removals once the source is changed.

F2. Duplicate/related Facebook profile or photo snippet - High (High)

Source: Facebook profile/photo snippet: [facebook.com/joshualukeparris/photos/d41d8cd9/10162799841139899/](https://www.facebook.com/joshualukeparris/photos/d41d8cd9/10162799841139899/)

Data exposed: A related public snippet repeated the same birth-announcement content, connected to the parent profile/photo area.

Why it matters: Duplicate public copies make removal harder and increase search discoverability.

Recommended action: Check the parent profile activity log, photo captions, shares, and group cross-posts. Remove or restrict every duplicate, not just the first result.

F3. Public child-specific Vercel app - High (High)

Source: <https://elias-app2.vercel.app/>

Data exposed: A public app named after the child is live on Vercel. The app name links the child first name to toddler interests and family-created content.

Why it matters: A child-named app creates a persistent public identifier and can be indexed, shared, archived, or linked from GitHub.

Recommended action: Delete the deployment or enable Vercel Deployment Protection. Rename to a neutral title such as TruckToolsPlay and remove the child name from metadata.

F4. Public GitHub repository tied to child app - High (High)

Source: <https://github.com/joshuaparris-max/EliasApp2>

Data exposed: The repository is public. Its README says the app is for the child and lists toddler interests such as trucks, tools, cars, construction, and parent-approved videos.

Why it matters: The repo links parent account + child first name + age-stage context + interests in a durable, crawlable developer platform.

Recommended action: Make the repository private. If kept public, rename it, remove child name references, remove family-specific wording, and strip child-linked metadata.

F5. Public app metadata contains child name - Medium (High)

Source: GitHub index.html and manifest.webmanifest in EliasApp2

Data exposed: Page title, Apple web app title, manifest name/short_name, icon filename, package naming, and description use EliasApp or child-first-name branding.

Why it matters: Metadata is often indexed by search engines, browser install prompts, social previews, and archives.

Recommended action: Change title, manifest name, short_name, icon names, repo name, package name, and SEO description to a neutral name.

F6. README references adding photos for the child - Medium (Medium-High)

Source: EliasApp2 README on GitHub

Data exposed: The README includes a section about adding photos for the child and suggests local image folders/filenames for tools.

Why it matters: Even if no private photos are currently confirmed, this invites accidental future upload of identifiable child photos to a public repo.

Recommended action: Remove that section or rewrite it as generic local-only guidance. Never commit child photos to public GitHub or Vercel assets.

F7. Public source code reveals child-specific interests - Medium (High)

Source: Raw GitHub files: `src/data/sections.js`, `src/data/tools.js`, `src/data/videos.js`

Data exposed: Public code reveals the app themes: garbage trucks, construction, cars, tools, screwdrivers, building, sorting, parking, sounds, and videos.

Why it matters: Interests alone are not severe, but paired with a child name and parent account they add to a profile of the child.

Recommended action: Neutralise naming and keep personalisation private. Use generic examples, not real-child profile data, in public code.

F8. Public embedded video list - Low-Medium (High)

Source: EliasApp2 `src/data/videos.js`

Data exposed: The app uses youtube-nocookie embeds for parent-approved videos. This is safer than random feeds but still public app content.

Why it matters: Not a direct privacy leak, but public child-named video curation adds to the child interest profile.

Recommended action: If app stays public, remove child naming and keep video curation generic. If used only at home, password-protect it.

F9. Search snippets connect parent public profiles to child exposure - Medium (High)

Source: Parent public profiles/snippets: YouTube, LinkedIn, Threads, Simple Wikipedia, Facebook snippets

Data exposed: Search results can connect the father profile, locations/work history, public bio, and the child-related content.

Why it matters: The child risk rises when parent identity, employment history, and family posts are all publicly linkable.

Recommended action: Reduce parent-profile linkage: remove child names from bios/captions, tighten social privacy, and keep public profiles professional/generic.

F10. Potential stale/archived search snippets - Medium (Medium)

Source: Google/Bing-style snippets returned pages that may be hard to fetch directly or may require login.

Data exposed: Search engines can preserve snippets after source content is changed, especially for public social posts and cached pages.

Why it matters: After deletion/privacy changes, old snippets may continue appearing until recrawled or removal is requested.

Recommended action: After changing source visibility, submit outdated-content removals to Google and Bing. Check Wayback Machine for child-named app URLs.

F11. Genealogy/profile ecosystem exposure around parent name - Low-Medium (Medium)

Source: WikiTree result for Joshua Parris and public genealogy results mentioning Parris family lines

Data exposed: Not a confirmed child exposure in this pass, but public genealogy pages can connect family structure and names over time.

Why it matters: Family-tree sites sometimes expose minors or parent-child relationships if privacy settings are loose.

Recommended action: Manually check any family tree accounts for living-person privacy and ensure children are private or omitted.

4. Images and Media Risk

No child images were copied into this report. Search snippets indicate at least one public Facebook photo/post area may be linked to the birth announcement. Manually inspect the original Facebook post, profile photo area, albums, and tags. Remove or restrict any public child face photos, birth captions, birthday posts, or family-location clues.

5. Health and Developmental Privacy Risk

No public health, scan, appointment, developmental, or childcare/preschool record for Elias was confirmed in this pass. The risk remains that parent posts or app prompts could accidentally expose sleep, health, routines, or parenting concerns. Keep these details out of public repos, public dashboards, and public social captions.

6. App, GitHub, and Vercel Risk

The public child-app cluster is the clearest controllable risk. The public Vercel deployment, repo name, README, index metadata, manifest, and source files make the child-first-name branding persistent across web, GitHub, and app-install contexts.

- [] Make EliasApp2 private or delete it.
- [] Delete/protect the Vercel deployment.
- [] Rename the app and repo to a neutral non-child name.
- [] Remove child-name metadata from index.html and manifest.webmanifest.
- [] Do not commit child photos/audio to public/media assets.
- [] Check GitHub history, branches, and old deployments.

7. Family and Location Inference

- A stranger could connect the child to Joshua through public Facebook snippets and GitHub/Vercel projects.
- A stranger could infer the child is a toddler/young child and has interests around trucks, tools, construction, vehicles, and building apps.
- The public birth-announcement snippet could support identity profiling, birthday-based security question guessing, or impersonation attempts against parents.
- Parent public profiles and work/location history increase the social-engineering surface. The safest approach is to keep child identity and parent professional identity separated online.
- No exploit steps are provided here. The point is to reduce public linkage and remove unnecessary child data.

8. Removal Plan

Do today

- [] Delete or restrict the Facebook birth announcement and any duplicate cross-posts/shares.
- [] Make <https://github.com/joshuaparris-max/EliasApp2> private today, or delete it if not needed.
- [] Delete or password-protect <https://elias-app2.vercel.app/> through Vercel Deployment Protection.
- [] Rename all public child-first-name metadata: app title, manifest, README, icon names, package names, repository names, and URLs.
- [] Search the exact full-name phrase after cleanup and submit outdated-content removal requests for remaining snippets.
- [] Do not upload child photos, voice/audio, therapy notes, scans, birth details, or routines to public repos or app assets.

Do this week

- [] Review Joshua and Kristy Facebook/Instagram/YouTube accounts for public posts that mention Elias, show his face, or include full name/birthday/location clues.
- [] Review relatives/friends tags and ask for public child posts to be removed or restricted to close friends.
- [] Check GitHub history and branches for older commits or screenshots containing child names/photos.
- [] Check Vercel deployments/preview URLs and delete old deployments where possible.
- [] Check Wayback Machine for child-named URLs and submit removal/exclusion requests for any captured pages.

Do this month

- [] Create a family rule: no child full names, exact birthdays, childcare/school names, health/developmental details, or public face photos unless both parents deliberately agree.
- [] Use neutral project names for child apps, such as TruckToolsPlay, TinyBuilder, BedtimeShelf, or FamilyPlayApp.
- [] Keep family apps private by default; make public only if fully anonymised and safe for strangers to view.
- [] Set up Google Alerts for exact name variants and app names.
- [] Repeat a child privacy audit quarterly, especially after creating apps or posting family milestones.

9. Takedown and Privacy Steps

Platform	Action
Facebook	Open the source post/photo. Change audience to Friends/Only me or delete it. Turn on Profile and Tagging review. After removal, request search cache updates.
Instagram	Review tagged photos and public posts. Remove tags or hide tagged photos. Keep child posts private or close-friends only.
GitHub	Repository > Settings > General > Danger Zone > Change visibility to private. Also check branches, commits, screenshots, Pages, and forks.
Vercel	Project > Settings > Deployment Protection. Use Vercel Authentication or Password Protection, or delete the project/deployments.
Google	Use Results About You / removal forms for personal info and under-18 exposure. Also use outdated-content removal after source pages are changed.
Bing	Use Bing Content Removal for outdated cache or blocked/deleted content.
Wayback Machine	Email/request exclusion for child-named app URLs or social pages you control, including URLs and date ranges.
YouTube	Set any child/family videos to Private or Unlisted. Remove full names, birthdays, and location clues from titles/descriptions.

10. Final Recommendations

Fix the birth-announcement snippets first, then the EliasApp GitHub/Vercel trail. Public child apps can be wonderful family tools, but they should be private by default or fully anonymised before public deployment.

For future child-related projects, build with neutral names, no full names, no face photos, no exact birthdays, no school/childcare references, no health or developmental notes, and no family routines.

Sources and Evidence URLs

Sources are listed for remediation. Sensitive snippets are summarised rather than repeated.

Public project seed URLs provided by parent/guardian

Limitations: This first pass used public search results and public URLs only. It did not access private social accounts, login-only pages, paid people-search databases, leaked data, or private systems. Some social pages could not be opened directly, but public search snippets were visible and are sufficient to trigger remediation.
